WEEK 1

01 - Introduction to Python-Variables-Datatypes Input/Output-Formatting

Ex. No. : 1.1 Date: 12-3-24

Register No.: 231801174 Name: SUDHA S P

1. Write a program to convert strings to an integer and float and display its type.

Sample Input:

10

10.9

Sample Output:

```
10,<class 'int'>
10.9,<class 'float'>

Program:
a=input()
b=int(a)
d=input()
c=float(d)
print(b,type(b),sep=",")
print(format(c,'0.1f'),type(c),sep=",")
```

	Input	Expected	Got	
~	10 10.9	10, <class 'int'=""> 10.9,<class 'float'=""></class></class>	10, <class 'int'=""> 10.9,<class 'float'=""></class></class>	~
~	12 12.5	12, <class 'int'=""> 12.5,<class 'float'=""></class></class>	12, <class 'int'=""> 12.5,<class 'float'=""></class></class>	~
~	89 7.56	89, <class 'int'=""> 7.6,<class 'float'=""></class></class>	89, <class 'int'=""> 7.6,<class 'float'=""></class></class>	~
~	55000 56.2	55000, <class 'int'=""> 56.2,<class 'float'=""></class></class>	55000, <class 'int'=""> 56.2,<class 'float'=""></class></class>	~
~	2541 2541.679	2541, <class 'int'=""> 2541.7,<class 'float'=""></class></class>	2541, <class 'int'=""> 2541.7,<class 'float'=""></class></class>	~

Ex. No. : 1.2 Date : 12-3-24

Register No.: 231801174 Name: SUDHA S P

2. Ramesh's basic salary is input through the keyboard. His dearness allowance is 40% of his basic salary, and his house rent allowance is 20% of his basic salary. Write a program to calculate his gross salary.

Sample Input:

10000

Sample Output:

16000

Program:

bs=int(input())

da = 0.4*bs

ra=0.2*bs

gs=bs+da+ra

print(int(gs))

	Input Expected		Got	
~	10000	16000	16000	~
~	20000	32000	32000	~
~	28000	44800	44800	~
~	5000	8000	8000	~

Ex. No. : 1.3 Date : 12-3-24

Register No.: 231801174 Name: SUDHA S P

3. Write a simple python program to find the square root of a given floating point number. The output should be displayed with 3 decimal places.

Sample Input:

8.00

Sample Output:

2.828

PROGRAM:

import math

a=float(input())

b=math.sqrt(a)

print(format(b,'0.3f'))

l .		
i		

	Input	Expected	Got	
~	8.00	2.828	2.828	~
~	14.00	3.742	3.742	~
~	4.00	2.000	2.000	~
~	487	22.068	22.068	~

Ex. No. : 1.4 Date: 12-3-24

Register No.: 231801174 Name: SUDHA S P

4. Alfred buys an old scooter for Rs. X and spends Rs. Y on its repairs. If he sells the scooter for Rs. Z (Z>X+Y). Write a program to help Alfred to find his gain percent. Get all the above-mentioned values through the keyboard and find the gain percent.

Input Format:

The first line contains the Rs X

The second line contains Rs Y

The third line contains Rs Z

Sample Input:

10000

250

15000

Sample Output:

46.34 is the gain percent.

PROGRAM:

X=int(input())

Y=int(input())

Z=int(input())

c=Z-(X+Y)

print(format((c*100)/(X+Y),'0.2f'),"is the gain percent.")

Ex. No. : 1.5 Date : 12-3-24

Register No.: 231801174 Name: SUDHA S P

5. In many jurisdictions, a small deposit is added to drink containers to encourage people to recycle them. In one particular jurisdiction, drink containers holding one liter or less have a \$0.10 deposit and drink containers holding more than one liter have a \$0.25 deposit. Write a program that reads the number of containers of each size(less and more) from the user. Your program should continue by computing and displaying the refund that will be received for returning those containers. Format the output so that it includes a dollar sign and always displays exactly two decimal places.

Sample Input

10

20

Sample Output

Your total refund will be \$6.00.

PROGRAM:

```
less=int(input())
more=int(input())
l=less*0.10
m=more*0.25
print("Your total refund will be",end=" ")
print("$",format(l+m,'0.2f'),".",sep="")
```

	Input	Expected	Got
~	20 20	Your total refund will be \$7.00.	Your total refund will be
~	11 22	Your total refund will be \$6.60.	Your total refund will be
~	123 200	Your total refund will be \$62.30.	Your total refund will be
~	76 38	Your total refund will be \$17.10.	Your total refund will be

Ex. No. : 1.6 Date: 12-3-24

Register No.: 231801174 Name: SUDHA S P

6. Justin is a carpenter who works on an hourly basis. He works in a company where he is paid Rs 50 for an hour on weekdays and Rs 80 for an hour on weekends. He works 10 hrs more on weekdays than weekends. If the salary paid for him is given, write a program to find the number of hours he has worked on weekdays and weekends.

Hint:

If the final result(hrs) are in -ve convert that to +ve using abs() function

The abs() function returns the absolute value of the given number.

```
number = -20
absolute_number = abs(number)
print(absolute_number)
# Output: 20
```

Sample Input:

450

Sample Output:

```
weekdays 10.38
weekend 0.38
```

Program:

```
salary=int(input())
b=(salary-500)/130
b=abs(b)
print("weekdays",(format(b+10,'0.2f')))
print("weekend",(format(b,'0.2f')))
```

	Input	Expected	Got	
~	450	weekdays 10.38 weekend 0.38	weekdays 10.38 weekend 0.38	*
~	500	weekdays 10.00 weekend 0.00	weekdays 10.00 weekend 0.00	~
~	10000	weekdays 83.08 weekend 73.08	weekdays 83.08 weekend 73.08	~
~	6789	weekdays 58.38 weekend 48.38	weekdays 58.38 weekend 48.38	*

Week 2

Ex. No. : 2.1 Date : 6-4-24

Register No.: 231801174 Name: SUDHA S P

1.Pretend that you have just opened a new savings account that earns 4 percent interest per year. The interest that you earn is paid at the end of the year, and is added to the balance of the savings account. Write a program that begins by reading the amount of money deposited into the account from the user. Then your program should compute and display the amount in the savings account after 1, 2, and 3 years. Display each amount so that it is rounded to 2 decimal places. Sample Input: 10000 Sample Output: Balance as of end of Year 1: \$10400.00. Balance as of end of Year 2: \$10816.00. Balance as of end of Year 3: \$11248.64.

For example:

Input	Result							
10000	Balance	as	of	end	of	Year	1:	\$10400.00.

```
Balance as of end of Year 2: $10816.00. Balance as of end of Year 3: $11248.64.
```

```
Program:
```

```
a=int(input())
```

b=a+(a*0.04)

print("Balance as of end of Year 1: \$",format(b,"0.2f"),".",sep="")

c=b+(b*0.04)

print("Balance as of end of Year 2: \$",format(c,"0.2f"),".",sep="")

d=c+(c*0.04)

print("Balance as of end of Year 3: \$",format(d,"0.2f"),".",sep="")

Output:

L				
		Input	Expected	Got
	*	10000	Balance as of end of Year 1: \$10400.00. Balance as of end of Year 2: \$10816.00. Balance as of end of Year 3: \$11248.64.	Balance as of end of Yea
	~	20000	Balance as of end of Year 1: \$20800.00. Balance as of end of Year 2: \$21632.00. Balance as of end of Year 3: \$22497.28.	Balance as of end of Yea

Ex. No. : 2.2 Date: 6-4-24

Register No.: 231801174 Name: SUDHA S P

2. Mr.Ram has been given a problem kindly help him to solve it. The input of the program is either 0 or 1. IF 0 is the input he should display "C" if 1 is the input it should display "D". There is a constraint that Mr. Ram should use either logical operators or arithmetic operators to solve the problem, not anything else.

Hint:

Use ASCII values of C and D.

Input Format:

An integer x, 0 <= x <= 1.

Output Format:

output a single character "C" or "D"depending on the value of x.

```
Input 1:
0
Output 1:
C
Input 2:
1
Output 1:
```

For example:

Input	Result
0	С

Program:

```
x=int(input())
if(x==0):
  print("C")
else:
  print("D")
```

	Input	Expected	Got	
~	0	С	С	~
•	1	D	D	~

Ex. No. : 2.3 Date : 6-4-24

Register No.: 231801174 Name: SUDHA S P

3. Write a program that returns the last digit of the given number. Last digit is being referred to the least significant digit i.e. the digit in the ones (units) place in the given number.

The last digit should be returned as a positive number.

For example,

if the given number is 197, the last digit is 7

if the given number is -197, the last digit is 7

For example:

Input	Result
197	7
-197	7

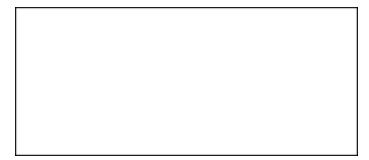

Program:

x=int(input())

x=abs(x)

z=x%10

print(z)

	Input	Expected Got		
~	197	7	7	~
~	-197	7	7	~

Ex. No. : 2.4 Date : 6-4-24

Register No.: 231801174 Name: SUDHA S P

4. Note:

Dont use if-else. Operators alone must be used .

A team from the Rotract club had planned to conduct a rally to create awareness among the Coimbatore people to donate blood. They conducted the rally successfully. Many of the Coimbatore people realized it and came forward to donate their blood to nearby blood banks. The eligibility criteria for donating blood are people should be above or equal to 18 and his/ her weight should be above 40. There was a huge crowd and staff in the blood bank found it difficult to manage the crowd. So they decided to keep a system and ask the people to enter their age and weight in the system. If a person is eligible he/she will be allowed inside.

Write a program and feed it to the system to find whether a person is eligible or not.

Input Format:

Input consists of two integers that correspond to the age and weight of a person respectively.

Output Format:

Display True(IF ELIGIBLE)

Display False (if not eligible)

```
Sample Input
19
45
Sample Output
True
```

For example:

Input	Result
18	False
40	

Program:

```
x=int(input())
y=int(input())
if((x>=18)and(y>40)):
    print("True")
else:
    print("False")
```

	Input	Expected	Got	
~	19 45	True	True	~
~	18 40	False	False	~
~	18 42	True	True	~
~	16 45	False	False	~

Ex. No. : 2.5 Date : 6-4-24

Register No.: 231801174 Name: SUDHA S P

5. Write a python program that takes a integer between 0 and 15 as input and displays the number of '1' s in its binary form.(Hint:use python bitwise operator.

Sample Input

3

Sample Output:

2

Explanation:

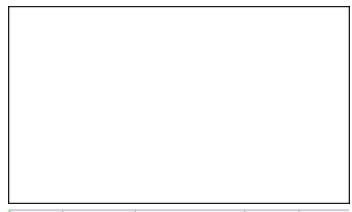

The binary representation of 3 is 011, hence there are 2 ones in it. so the output is 2.

For example:

Input	Result
3	2

Program:

```
num=int(input())
if 0<=num<=15:
  binary=bin(num)
  c=binary.count('1')
  print(c)</pre>
```

	Input	Expected	Got	
~	3	2	2	~
~	5	2	2	~
~	15	4	4	~

Ex. No. : 2.6 Date: 6-4-24

Register No.: 231801174 Name: SUDHA S P

6. The program that you create for this exercise will begin by reading the cost of a meal ordered at a restaurant from the user. Then your program will compute the tax and tip for the meal. Use your local tax rate (5 percent) when computing the amount of tax owing. Compute the tip as 18 percent of the meal amount (without the tax). The output from your program should include the tax amount, the tip amount, and the grand total for the meal including both the tax and the tip. Format the output so that all of the values are displayed using two decimal places.

Sample Input

100

Sample Output

The tax is 5.00 and the tip is 18.00, making the total 123.00

For example:

Input	Result											
100	The tax	is	5.00	and	the	tip	is	18.00,	making	the	total	123.00

```
Program:
c=int(input())
m=c*0.05
```

a=format(m, '0.02f')

n=c*0.18

b = format(n, '0.02f')

d=format(m+n+c, '0.02f')

print("The tax is ",a," and the tip is ",b,", making the total ",d,sep="")

Output:

			_
	Input	Expected	(
~	100	The tax is 5.00 and the tip is 18.00, making the total 123.00	1
~	250	The tax is 12.50 and the tip is 45.00, making the total 307.50	1

Ex. No. : 2.7 Date: 6-4-24

Register No.: 231801174 Name: SUDHA S P

7. Mr. X's birthday is in next month. This time he is planning to invite N of his friends. He wants to distribute some chocolates to all of his friends after the party. He went to a shop to buy a packet of chocolates. At the chocolate shop, 4 packets are there with different numbers of chocolates. He wants to buy such a packet which contains a number of chocolates, which can be distributed equally among all of his friends. Help Mr. X to buy such a packet.

Input Given:

N-No of friends

P1,P2,P3 AND P4-No of chocolates

"True" if he can buy that packet and "False" if he can't buy that packet. SAMPLE INPUT AND OUTPUT:

5

25

12

10

9

OUTPUT

True False True False

For example:

Input	Result					
5	True False True True					
25						
23						
20						
10						

```
Program:
```

```
n=int(input())
```

```
p1=int(input())
```

```
p2=int(input())
```

p3=int(input())

p4=int(input())

if(p1%n==0):

print("True",end=" ")

else:

```
print("False",end=" ")
```

if(p2%n==0):

print("True",end=" ")

else:

print("False",end=" ")

if(p3%n==0):

print("True",end=" ")

```
else:

print("False",end=" ")

if(p4%n==0):

print("True",end=" ")

else:

print("False",end=" ")
```

	Input	Expected	Got	
*	5 25 23 20 10	True False True True	True False True True	*
~	4 23 24 21 12	False True False True	False True False True	*
*	8 64 8 16 32	True True True	True True True	~

Ex. No. : 2.8 Date: 6-4-24

Register No.: 231801174 Name: SUDHA S P

8. An online retailer sells two products: widgets and gizmos. Each widget weighs 75 grams. Each gizmo weighs 112 grams. Write a program that reads the number of widgets and the number of gizmos from the user. Then your program should compute and display the total weight of the parts.

Sample Input:

10

20

Sample Output:

The total weight of all these widgets and gizmos is 2990 grams.

```
w=int(input())
w=w*75
g=int(input())
g=g*112
tot=w+g
print("The total weight of all these widgets and gizmos is",tot,"grams.")
output:
```

	Input	Expected									
~	10 20	The total	weight	of a	all f	these	widgets	and	gizmos	is	2990
Got											

The total weight of all these widgets and gizmos is 2990 grams.

Ex. No. : 2.9 Date : 6-4-24 Register No.: 231801174 Name: SUDHA S P

9. In London, every year during Dasara there will be a very grand doll show. People try to invent new dolls of different varieties. The best-sold doll's creator will be awarded with a cash prize. So people broke their heads to create dolls innovatively. Knowing this competition, Mr.Lokpaul tried to create a doll that sings only when an even number is pressed and the number should not be zero and greater than 100.

IF Lokpaul wins print true, otherwise false.

Sample Input

```
10
```

Sample Output

True

Explanation:

Since 10 is an even number and a number between 0 and 100, True is printed

For example:

Input	Result
101	False

```
x=int(input())
if(x>0):
    if(x%2==0):
        print("True")
    else:
        print("False")
else:
    print("False")
output:
```

	Input	Expected	Got	
~	56	True	True	~
~	101	False	False	~
~	-1	False	False	~

Register No.: 231801174 Name: SUDHA S P

10. In the 1800s, the battle of Troy was led by Hercules. He was a superstitious person. He believed that his crew can win the battle only if the total count of the weapons in hand is in multiple of 3 and the soldiers are in an even number of count. Given the total number of weapons and the soldier's count, Find whether the battle can be won or not according to Hercules's belief. If the battle can be won print True otherwise print False.

Input format:

Line 1 has the total number of weapons

Line 2 has the total number of Soldiers.

Output Format:

If the battle can be won print True otherwise print False.

Sample Input:

32

43

Sample Output:'

False

For example:

Input	Result
32	False
43	

```
w=int(input())
s=int(input())
if(w%3==0 and s%2==0):
   print("True")
else:
   print("False")
```

	Input	Expected	Got	
*	32 43	False	False	~
~	273 7890	True	True	~
~	800 4590	False	False	~

Ex. No. : 3.1 Date: 12-4-24

Register No.: 231801174 Name: SUDHA S P

1. Write a program that returns the second last digit of the given number. Second last digit is being referred 10the digit in the tens place in the given number.

For example, if the given number is 197, the second last digit is 9.

Note1 - The second last digit should be returned as a positive number. i.e. if the given number is -197, the second last digit is 9.

Note2 - If the given number is a single digit number, then the second last digit does not exist. In such cases, the program should return -1. i.e. if the given number is 5, the second last digit should be returned as -1

For example:

Input	Result
197	9
5	-1

Program:

x=int(input())

x=abs(x)

if(x>=10):

a=x//10

x=a%10

print(x)

else:

print("-1")

	Input	Expected	Got	
~	197	9	9	~
~	-197	9	9	~
~	5	-1	-1	~
~	123456	5	5	~
~	8	-1	-1	~

2. A triangle can be classified based on the lengths of its sides as equilateral, isosceles or scalene. All three sides of an equilateral triangle have the same length. An isosceles triangle has two sides that are the same length, and a third side that is a different length. If all of the sides have different lengths then the triangle is scalene.

Write a program that reads the lengths of the three sides of a triangle from the user. Then display a message that states the triangle's type.

Sample Input 1

60

60

60

Sample Output 1

That's a equilateral triangle

Sample Input 2

40

40

80

Sample Output 2

That's a isosceles triangle

Sample Input 3

50

60

70

Sample Output 3

That's a scalene triangle

For example:

Input	Result
60	That's a equilateral triangle
60	
60	
40	That's a isosceles triangle
40	
80	

```
s1=int(input())
s2=int(input())
s3=int(input())
if(s1==s2==s3):
    print("That's a equilateral triangle")
elif(s1==s2!=s3):
    print("That's a isosceles triangle")
else:
    print("That's a scalene triangle")
```

	Input	Expected	Got
*	60 60 60	That's a equilateral triangle	That's a equilateral trian
*	40 40 80	That's a isosceles triangle	That's a isosceles triangle
*	50 60 70	That's a scalene triangle	That's a scalene triangle
~	50 50 80	That's a isosceles triangle	That's a isosceles triangle
*	10 10 10	That's a equilateral triangle	That's a equilateral trian

3. IN / OUT

Ms. Sita, the faculty handling programming lab for you is very strict. Your seniors have told you that she will not allow you to enter the week's lab if you have not completed atleast half the number of problems given last week. Many of you didn't understand this statement and so they requested the good programmers from your batch to write a program to find whether a student will be allowed into a week's lab given the number of problems given last week and the number of problems solved by the student in that week.

Input Format:

Input consists of 2 integers.

The first integer corresponds to the number of problems given and the second integer corresponds to the number of problems solved.

Output Format:

Output consists of the string "IN" or "OUT".

Sample Input and Output:

Input

8

3

Output

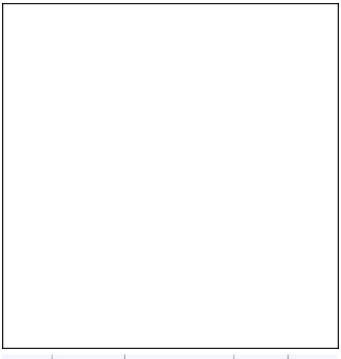

OUT

For example:

Input	Result
8	OUT
3	

Program:

```
given=int(input())
solved=int(input())
s=solved
g=given//2
if(s>=g):
    print("IN")
else:
    print("OUT")
```

	Input	Expected	Got	
~	8	OUT	OUT	*
~	8	IN	IN	~
*	20 9	OUT	OUT	*
~	50 31	IN	IN	~

4. Write a program to calculate and print the Electricity bill where the unit consumed by the user is given from test case. It prints the total amount the customer has to pay. The charge are as follows:

Unit Charge / Unit

Upto 199 @1.20

200 and above but less than 400 @1.50

400 and above but less than 600 @1.80

600 and above @2.00

If bill exceeds Rs.400 then a surcharge of 15% will be charged and the minimum bill should be of Rs.100/-

Sample Test Cases

Test Case 1

Input

50

Output

100.00

Test Case 2

Input

300

Output

517.50

For example:

Input	Result
100 00	120 00

```
a=float(input())

if(a<200 and (a*1.20)<100):

print(format(100,'0.2f'))

elif(a<200 and (a*1.20)>100):

print(format(a*1.20,'0.2f'))

elif(a>=200 and (a*1.50)<400) and a<400:

print(format(a*1.50,'0.2f'))
```

```
elif(a>=200 and a<400 and (a*1.50)>400):

print(format(a*1.50+(a*1.50*0.15),'0.2f'))

elif(a>=400 and a<600):

print(format((a*1.80)+(a*1.80*0.15),'0.2f'))

elif(a>=600):

print(format((a*2.00)+(a*2.00*0.15),'0.2f'))
```

5. The Chinese zodiac assigns animals to years in a 12 year cycle. One 12 year cycle is shown in the table below. The pattern repeats from there, with 2012 being another year of the dragon, and 1999 being another year of the hare.

Year Animal

2000 Dragon

2001 Snake

2002 Horse

2003 Sheep

2004 Monkey

2005 Rooster

2006 Dog

2007 Pig

2008 Rat

2009 Ox

2010 Tiger

2011 Hare

Write a program that reads a year from the user and displays the animal associated with that year. Your program should work correctly for any year greater than or equal to zero, not just the ones listed in the table.

Sample Input 1

2010

Sample Output 1

2010 is the year of the Tiger.

Sample Input 2

2020

```
Sample Output 2
```

2020 is the year of the Rat.

Program:

```
a=int(input())
```

b=a%12

 $\label{eq:content} $$c=["Monkey","Rooster","Dog","Pig","Rat","Ox","Tiger","Hare","Dragon","Snake","Horse","Sheep"]$

print(a,"is the year of the",c[b],end=".")

	Input	Expected	Got
~	2010	2010 is the year of the Tiger.	2010 is the year of the T
~	2020	2020 is the year of the Rat.	2020 is the year of the R

Ex. No. : 3.6 Date: 12-4-24

Register No.: 231801174 Name: SUDHA S P

6. Most years have 365 days. However, the time required for the Earth to orbit the Sun is actually slightly more than that. As a result, an extra day, February 29, is included in some years to correct for this difference. Such years are referred to as leap years. The rules for determining whether or not a year is a leap year follow:

- · Any year that is divisible by 400 is a leap year.
- Of the remaining years, any year that is divisible by 100 is not a leap year.
- Of the remaining years, any year that is divisible by 4 is a leap year.
- · All other years are not leap years.

Write a program that reads a year from the user and displays a message indicating whether or not it is a leap year.

Sample Input 1

1900

Sample Output 1

1900 is not a leap year.

Sample Input 2

2000

Sample Output 2

2000 is a leap year.

```
Program:
```

```
y=int(input())
if(y%400==0):
    print(y,"is a leap year.")
else:
    print(y,"is not a leap year.")
```

7. The length of a month varies from 28 to 31 days. In this exercise you will create a program that reads the name of a month from the user as a string. Then your program should display the number of days in that month. Display "28 or 29 days" for February so that leap years are addressed.

Sample Input 1

February

Sample Output 1

February has 28 or 29 days in it.

```
Sample Input 2
March
Sample Output 2
March has 31 days in it.
Sample Input 3
April
Sample Output 3
April has 30 days in it.
```

For example:

Input	Result							
February	February	has	28	or	29	days	in	it.

Program:

```
a=input()
b=["January","March","May","July","August","October","December"]
c=["April","June","September","November"]
d=["February"]
if a in b:
    print(a,"has 31 days in it.")
elif a in c:
    print(a,"has 30 days in it.")
elif a in d:
    print(a,"has 28 or 29 days in it.")
```

	Input	Expected	Got
~	February	February has 28 or 29 days in it.	February has 28 or 29 da
~	March	March has 31 days in it.	March has 31 days in it.
~	April	April has 30 days in it.	April has 30 days in it.

Week-4

Ex. No. : 4.1 Date: 13-4-24

Register No.: 231801174 Name: SUDHA S P

In mathematics, the factorial of a non-negative integer n, denoted by n!, is the product of all positive integers less than or equal to n. For example,

Write a program to find the factorial of a given number.

The given number will be passed to the program as an input of type int.

The program is expected to calculate the factorial of the given number and return it as an int type.

Assumptions for this program:

The given input number will always be greater than or equal to 1.

Due to the range supported by int. the input numbers will range from 1 to 12.

For example:		
Input	Result	
5	120	
4	24	
9	362880	

Program:

a=int(input())

s=1

```
for i in range(1,a+1):

s=s*i

print(s)

Output:
```

	Input	Expected	Got	
~	5	120	120	~
~	4	24	24	~
~	9	362880	362880	~

Ex. No. : 4.2

Register No.: 231801174 Name: SUDHA S P

2. Rakesh loves playing with numbers. He took the Fibonacci series and wants to find the sum of squares of the series until a given value. Write a code that implements his task.

Input Format:

Single Integer N

Output Format:

Display the sum of squares of the Fibonacci series until the Nth term.

Example Input: 9

Output: 1870

Explanation:

The numbers are: 1123 5 8 13 21 34

Sum of their squares is: 1 + 1+4+9+25+64 + 169 + 441 + 1156 1870

For example:
Input
9

Result
1870

Program:

n=int(input())

$$a, b = 0, 1$$

$$s = 0$$

for i in range(n):

$$s = s + (b **2)$$

print(s)

	Input	Expected	Got	
~	9	1870	1870	~

Ex. No. : 4.3 Date: 13-4-24

Register No.: 231801174 Name: SUDHA S P

3. An abundant number is a number for which the sum of its proper divisors is greater than the number itself.

Proper divisors of the number are those that are strictly lesser than the number.

Input Format:

Take input an integer from stdin

Output Format:

Print Yes if given number is Abundant. Otherwise, print No

Example input:

12

Output:

Yes

Explanation

The proper divisors of 12 are: 1, 2, 3, 4, 6, whose sum is 1 + 2 + 3 + 4 + 6 16. Since sum of proper divisors is greater than the given number, 12 is an abundant number.

Example input:

13

Output:

No

Explanation

The proper divisors of 13 is: 1, whose sum is 1. Since sum of proper divisors is not greater than the given number, 13 is not an abundant number.

Program:

```
n=int(input())
s=0
for i in range(1,n):
    if (n%i==0):
        s=s+i

if (s>n):
    print("Yes")
else:
    print("No")
```

	Input	Expected	Got

5. Given an integer N, check whether N the given number can be made a perfect square after adding to it.

Input Format:

Single integer input.

Output Format:

Yes or No.

Example Input:

24

Output:

Yes

Example Input:

26

Output:

No

Program:

```
import math
n=int(input())
x=n+1
z=math.sqrt(x)
if (z==int(z)):
    print("Yes")
else:
    print("No")
Output:
```

	Input	Expected	Got

Ex. No. : 4.6 Date: 13-4-24

Register No.: 231801174 Name: SUDHA S P

6. Write a program that finds whether the given number N is Prime or not. If the number is prime, the program should return 2 else it must return 1.

Assumption: 2<=N<=5000, where N is the given number.

Example 1: if the given number N is 7, the method must return 2

Example 2: if the given number N is 10, the method must return 1

In 7

For example:

Input	Result
7	2
10	1

Program:

```
n=int(input())
a=0
if(2<=n<=5000):
    for i in range(1,n+1):
        if(n%i==0):
        a+=1
else:
    result=1
if(a<=2):
    result=2
else:
    result=1
print(result)</pre>
```

	Input	Expected	Got	
~	7	2	2	~
~	10	1	1	~

Ex. No. : 4.7 Date: 13-4-24

Register No.: 231801174 Name: SUDHA S P

7. Write a program to return the nth number in the fibonacci series.

The value of N will be passed to the program as input.

NOTE: Fibonacci series looks like -

0, 1, 1, 2, 3, 5, 8, 13, 21, 34, 55,... and so on.

i.e. Fibonacci series starts with 0 and 1, and continues generating the next number as the sum of the previous two numbers.

- first Fibonacci number is 0,
- second Fibonacci number is 1,
- third Fibonacci number is 1,
- fourth Fibonacci number is 2,
- fifth Fibonacci number is 3,
- sixth Fibonacci number is 5,
- seventh Fibonacci number is 8, and so on.

9. Write a program to find the count of unique digits in a given number N. The number will be passed to the program as an input of type int.

Assumption: The input number will be a positive integer number >= 1 and <= 25000.

For e.g.

If the given number is 292, the program should return 2 because there are only 2 unique digits '2' and '9' in this number

If the given number is 1015, the program should return 3 because there are 3 unique digits in this number, '1', '0', and '5'.

For example:

Input	Result
292	2
1015	3

Program:

N=input()

C=len(set(N))

Print(C)

	Input	Expected	Got	
~	292	2	2	~
~	1015	3	3	~
~	123	3	3	~

Ex. No. : 4.10 Date : 13-4-24

Register No.: 231801174 Name: SUDHASP

10. Given a number N, find the next perfect square greater than N.

Input Format:

Integer input from stdin.

Output Format:

Perfect square greater than N.

Example input:

10

```
Output: 16
```

Program:

```
import math
n=int(input())
z=n+1
while z>0:
    m=math.sqrt(z)
    if(m==int(m)):
        print(z)
        break
    else:
        z=z+1
```

Ex. No. : 5.2 Date : 17-4-24

Register No.: 231801174 Name: SUDHA S P

2. Write a program that takes as input a string (sentence), and returns its second word in uppercase.

For example:

If input is "Wipro Technologies Bangalore" the function should return "TECHNOLOGIES"

If input is "Hello World" the function should return "WORLD"

If input is "Hello" the program should return "LESS"

NOTE 1: If input is a sentence with less than 2 words, the program should return the word "LESS".

NOTE 2: The result should have no leading or trailing spaces.

For example:

Input	Result
Wipro Technologies Bangalore	TECHNOLOGIES
Hello World	WORLD
Hello	LESS

Program:

```
s1=input()
x=s1.split()
if(len(x)>=2):
    print(x[1].upper())
else:
    print("LESS")
```

	Input	Expected	Got

~	Ynf PYnative	False	False	~

Ex. No. : 5.5 Date: 17-04-24 Register No.: 231801174 Name: SUDHA S P

5. Given a string S, which contains several words, print the count C of the words whose length is atleast L. (You can include punctuation marks like comma, full stop also as part of the word length. Space alone must be ignored)

Input Format:

The first line contains S. The second line contains L.

Output Format:

The first line contains C

Boundary Conditions:

2 <= Length of S <= 1000

Example Input/Output 1:

Input:

During and after Kenyattas inauguration police elsewhere in the capital, Nairobi, tried to stop the opposition from holding peaceful demonstrations.

Output:

13

Explanation:

The words of minimum length 5 are During after
Kenyattas
inauguration police elsewhere capital,
Nairobi, tried opposition holding

peaceful demonstrations.

Program:

s=input()

L=int(input())

words=s.split()

c=0

for word in words:

if len(word)>=L:

c=c+1

print(c)

Output:

Input	Expected	Got	
During and after Kenyattas inauguration police elsewhere in the capital, Nairobi, tried to stop the opposition from holding peaceful demonstrations. 5	13	13

Register No.: 231801174 Name: SUDHA S P

6. Two string values S1, S2 are passed as the input. The program must print first N characters present in S1 which are also present in S2.

Input Format:

```
The first line contains S1.
The second line contains S2.
The third line contains N.
```

Output Format:

The first line contains the N characters present in S1 which are also present in S2.

Boundary Conditions:

```
2 <= N <= 10
2 <= Length of S1, S2 <= 1000
```

Example Input/Output 1:

Input:

abcbde cdefghbb

Output:

bcd

Note:

b occurs twice in common but must be printed only once.

Program:

```
s1=input()
s2=input()
N=int(input())
s2set=set(s2)
cc=[]
c=0
for char in s1:
  if char in s2set and char not in cc:
      cc.append(char)
      c=c+1
      if c==N:
```

break		
x=".join(cc)		
print(x)		
Output:		

	Input	Expected	Got

9. Reverse a string without affecting special characters

Given a string **S**, containing special characters and all the alphabets, reverse the string without affecting the positions of the special characters.

Input: A&B Output: B&A

Explanation: As we ignore '&' and

As we ignore '&' and then reverse, so answer is "B&A".

For example:

Input	Result
A&x#	x&A#

Program:

s=input()

I=[]

for i in s:

if(i.isalpha()):

```
l.append(i)
l.reverse()
r="
index=0
for i in s:
    if(i.isalpha()):
        r+=l[index]
        index+=1
    else:
        r+=i
print(r)
```

	Input	Expected	Got	
~	A&B	B&A	В&А	~

Register No.: 231801174 Name: SUDHA S P

10. Given a string S which is of the format USERNAME@DOMAIN.EXTENSION, the program must print the EXTENSION, DOMAIN, USERNAME in the reverse order.

Input Format:

The first line contains S.

Output Format:

The first line contains EXTENSION. The second line contains DOMAIN. The third line contains USERNAME.

Boundary Condition:

1 <= Length of S <= 100

Example Input/Output 1:

Input:

abcd@gmail.com

Output:

com gmail abcd

For example:

Input	Result
arvijayakumar@rajalakshmi.edu.in	edu.in rajalakshmi arvijayakumar

Program:

s=input()

at=s.index('@')

dot=s.index(")

username=s[:at]

domain=s[at+1:dot]

exten=s[dot+1:]

2. Write a program to print all the locations at which a particular element (taken as input) is found in a list and also print the total number of times it occurs in the list. The location starts from 1.

For example, if there are 4 elements in the array:

5

6

5

7

If the element to search is 5 then the output will be:

5 is present at location 1

5 is present at location 3

5 is present 2 times in the array.

Sample Test Cases

Test Case 1

Input

4

5

```
6
5
7
5
Output
5 is present at location 1.
5 is present at location 3.
5 is present 2 times in the array.
Test Case 2
Input
5
67
80
45
97
100
50
Output
50 is not present in the array.
Program:
n = int(input())
arr = [int(input()) for _ in range(n)]
element_to_search = int(input())
locations = []
occurrences = 0
for i in range(len(arr)):
  if arr[i] == element_to_search:
     locations.append(i + 1)
     occurrences += 1
# Output
if occurrences == 0:
```

```
print(f"{element_to_search} is not present in the array.")
else:

for loc in locations:
    print(f"{element_to_search} is present at location {loc}.")
    print(f"{element_to_search} is present {occurrences} times in the array.")

3. Find the intersection of two sorted arrays.

OR in other words,

Given 2 sorted arrays, find all the elements which occur in both the arrays.

Input Format

The first line contains T, the number of test cases. Following T lines contain:

- 1. Line 1 contains N1, followed by N1 integers of the first array
- 2. Line 2 contains N2, followed by N2 integers of the second array

Output Format

The intersection of the arrays in a single line

Example

Input:

1

3 10 17 57

6 2 7 10 15 57 246

Output:

10 57

Input:

1

7

1

2

3

3

4

5

```
6216Output:1 6
```

For example:

Input	Result
1 3 10 17 57 6 2 7 10 15 57 246	10 57
1 7 1 2 3 3 4 5 6 2 1 6	1 6

Program:

```
t=int(input())

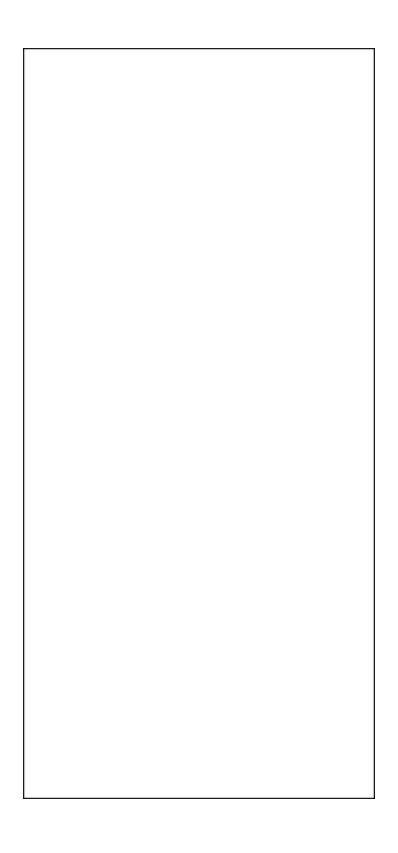

11=list()

while(t!=0):

n1=int(input())

11=[]
```

```
12=[]
  for i in range(0,n1):
     a=int(input())
    11.append(a)
  n2=int(input())
  for i in range(0,n2):
     a=int(input())
    12.append(a)

6. Given two lists A and B, and B is an anagram of A. B is an anagram of A means B is made by randomizing the order of the elements in A.

We want to find an *index mapping* P, from A to B. A mapping P[i] = j means the ith element in A appears in B at index j.

These lists A and B may contain duplicates. If there are multiple answers, output any of them.

For example, given

Input

5

12 28 46 32 50

50 12 32 46 28

14320

Explanation

```
A = [12, 28, 46, 32, 50]
```

B = [50, 12, 32, 46, 28]

We should return

[1, 4, 3, 2, 0]

as P[O] = 1 because the 0th element of A appears at B[1], and P[1] = 4 because the 1st element of A appears at B[4], and so on.

Note:

- A, B have equal lengths in range [1, 100].
- A[i], B[i] are integers in range [0, 10⁵].

Program:

```
def index_mapping(A, B):
   index_map = {num: i for i, num in enumerate(B)}
   return ' '.join(str(index_map[num]) for num in A)

n = int(input())
A = list(map(int, input().split()))
B = list(map(int, input().split()))
```

Output:

print(index_mapping(A, B))

	Input	Expected	Got

10. Given an array of numbers, find the index of the smallest array element (the pivot), for which the sums of all elements to the left and to the right are equal. The array may not be reordered.

Example

arr=[1,2,3,4,6]

- the sum of the first three elements, 1+2+3=6. The value of the last element is 6.
- Using zero based indexing, arr[3]=4 is the pivot between the two subarrays.
- The index of the pivot is 3.

Constraints

- · 3 < n < 10⁵
- 1 ≤ arr[i] ≤ 2×10^4 , where $0 \le i < n$
- It is guaranteed that a solution always exists.

The first line contains an integer n, the size of the array arr.

Each of the next n lines contains an integer, arr[i], where $0 \le i < n$.

Sample Case 0

Sample Input 0

1

1

2

3

3

Sample Output 0

2

Explanation 0

- The sum of the first two elements, 1+2=3. The value of the last element is 3.
- Using zero based indexing, arr[2]=3 is the pivot between the two subarrays.
- The index of the pivot is 2.

```
Sample Case 1
Sample Input 1
3
1
2
1
Sample Output 1
1
Explanation 1
```

- The first and last elements are equal to 1.
- Using zero based indexing, arr[1]=2 is the pivot between the two subarrays.
- The index of the pivot is 1.

For example:

Input	Result
4	2
1	
2	
3	
3	
3	1
1	
2	
1	

Program:

```
def find_pivot_index(arr):
  total_sum = sum(arr)
  left_sum = 0
  for i, num in enumerate(arr):
    total_sum -= num
  if left_sum == total_sum:
    return i
  left_sum += num
```

```
return -1
```

```
n = int(input())
arr = [int(input()) for _ in range(n)]
print(find_pivot_index(arr))
```

Ex. No. : 7.1 Date : 18-5-24

Register No.: 231801174 Name: SUDHA S P

1. Given an array of integers nums containing n+1 integers where each integer is in the range [1, n] inclusive. There is only **one repeated number** in nums, return this repeated number. Solve the problem using set.

Example 1:

Input: nums = [1,3,4,2,2]

Output: 2 Example 2:

Input: nums = [3,1,3,4,2]

Output: 3

For example:

Input	Result
1 3 4 4 2	4

Program:

def findDuplicate(nums):

$$seen = set()$$

for num in nums:

```
if num in seen:
    return num
    seen.add(num)

user_list = [int(x) for x in input().split()]

print(findDuplicate(user_list))
```

	Input	Expected	Got	
~	1 3 4 4 2	4	4	~
~	1 2 2 3 4 5 6 7	2	2	~

2. There is a malfunctioning keyboard where some letter keys do not work. All other keys on the keyboard work properly.

Given a string text of words separated by a single space (no leading or trailing spaces) and a string brokenLetters of all distinct letter keys that are broken, return the number of words in text you can fully type using this keyboard.

Example 1:

Input: text = "hello world", brokenLetters = "ad"

Output:

1

Explanation: We cannot type "world" because the 'd' key is

Program:

text=input()

brok=input()			
c=0			
for i in brok:			
if i in text:			
c=c+1			
print(c)			
Output:			

	Input	Expected	Got	
~	hello world ad	1	1	*

- 3. The **DNA sequence** is composed of a series of nucleotides abbreviated as 'A', 'C', 'G', and 'T'.
 - For example, "ACGAATTCCG" is a **DNA sequence**.

When studying **DNA**, it is useful to identify repeated sequences within the DNA.

Given a string s that represents a **DNA sequence**, return all the **10-letter-long** sequences (substrings) that occur more than once in a DNA molecule. You may return the answer in **any order**.

Example 1:

```
Input: s = "AAAAAACCCCCAAAAACCCCCCAAAAAAGGGTTT"
Output: ["AAAAAACCCCC","CCCCCAAAAA"]
Example 2:
Input: s = "AAAAAAAAAAAAA"
Output: ["AAAAAAAAAAA"]
```

For example:

Input	Result
AAAAACCCCCAAAAACCCCCCAAAAAGGGTTT	AAAAACCCCC
	CCCCCAAAAA

Program:

```
def findRepeatedSequences(s):
    sequences = {}
    result = []
    for i in range(len(s) - 9):
        seq = s[i:i+10]
        sequences[seq] = sequences.get(seq, 0) + 1
        if sequences[seq] == 2:
        result.append(seq)
    return result
```

```
# Example usage
s1 = input()
```

or i in findRepeatedSequences(s1)	:
print(i)	

Output:					

	Input	Expected	Got	
*	AAAAACCCCCAAAAACCCCCCAAAAAAGGGTTT	AAAAACCCCC	AAAAACCCCC CCCCCAAAAA	~
~	ΑΑΑΑΑΑΑΑΑΑΑ	АААААААА	АААААААА	~

Ex. No. 7.4 Date: 18-05-24

Register No.: 231801174 Name: SUDHA S P

4. Given a tuple and a positive integer k, the task is to find the count of distinct pairs in the tuple whose sum is equal to **K**.

Examples:

Input: t = (5, 6, 5, 7, 7, 8), K = 13

Output: 2 **Explanation:**

Pairs with sum K(=13) are $\{(5, 8), (6, 7), (6, 7)\}$.

Therefore, distinct pairs with sum K(=13) are $\{(5, 8), (6, 7)\}$. Therefore, the required output is 2.

For example:

Input	Result
1,2,1,2,5	1
1,2	0

Program:

def count distinct pairs(t, K):

distinct_pairs = set()

for i in range(len(t)):

```
for j in range(i + 1, len(t)):
    if t[i] + t[j] == K:
        distinct_pairs.add((min(t[i], t[j]), max(t[i], t[j])))
    return len(distinct_pairs)

t_input = input()
t = tuple(map(int, t_input.split(',')))
K = int(input())
print(count_distinct_pairs(t, K))
Output:
```

	Input	Expected	Got	
*	5,6,5,7,7,8 13	2	2	~
~	1,2,1,2,5 3	1	1	~
~	1,2 0	0	0	*

5. Given an array of strings words, return the words that can be typed using letters of the alphabet on only one row of American keyboard like the image below.

In the American keyboard:

- the first row consists of the characters "qwertyuiop",
- the second row consists of the characters "asdfghjkl", and
- the third row consists of the characters "zxcvbnm".

Example 1:

```
Input: words = ["Hello","Alaska","Dad","Peace"]
Output: ["Alaska","Dad"]
Example 2:
Input: words = ["omk"]
Output: []
Example 3:
Input: words = ["adsdf","sfd"]
Output: ["adsdf","sfd"]
```

For example:

Input	Result

4	Alaska
Hello	Dad
Alaska	
Dad	
Peace	
2	adsfd
adsfd	afd
afd	

Program:

```
def findWords(words):
  row1 = set('qwertyuiop')
  row2 = set('asdfghjkl')
  row3 = set('zxcvbnm')
  result = []
  for word in words:
    w = set(word.lower())
    if w.issubset(row1) or w.issubset(row2) or w.issubset(row3):
       result.append(word)
  if len(result) == 0:
    print("No words")
  else:
     for i in result:
       print(i)
a = int(input())
arr = [input() for i in range(a)]
findWords(arr)
```

	Input	Expected	Got	
~	4 Hello Alaska Dad Peace	Alaska Dad	Alaska Dad	*
~	1 omk	No words	No words	~
~	2 adsfd afd	adsfd afd	adsfd afd	*

Week-8

Ex. No. : 8.1 Date: 25-05-24 Register No.: 231801174 Name: SUDHA S P

1. In the game of Scrabble[™], each letter has points associated with it. The total score of a word is the sum of the scores of its letters. More common letters are worth fewer points while less common letters are worth more points. The points associated with each letter are shown below:

Points Letters

1 A, E, I, L, N, O, R, S, T and U

2 D and G

3 B, C, M and P

4 F. H. V. W and Y

5 K

8 J and X

10 Q and Z

Write a program that computes and displays the Scrabble™ score for a word. Create a dictionary that maps from letters to point values. Then use the dictionary to compute the score.

A Scrabble™ board includes some squares that multiply the value of a letter or the value of an entire word. We will ignore these squares in this exercise.

Sample Input

REC

Sample Output

REC is worth 5 points.

For example:

Input	Result
REC	REC is worth 5 points.

Program:

```
word=input().upper()
s=0
one=['A','E','I','L','N','O','R','S','T','U']
two=['D','G']
```

```
three=['B','C','M','P']
four=['F','H','V','W','Y']
five=['Q','Z']
for i in word:
  if i in one:
     s=s+1
  elif i in two:
     s=s+2
  elif i in three:
     s=s+3
  elif i in four:
     s=s+4
  else:
     s=s+5
print(f"{word} is worth {s} points.")
  Output:
```

	Input	Expected	Got	
~	GOD	GOD is worth 5 points.	GOD is worth 5 points.	~
~	REC	REC is worth 5 points.	REC is worth 5 points.	~

2. Create a student dictionary for n students with the student name as key and their test mark assignment mark and lab mark as values. Do the following computations and display the result.

1.Identify the student with the highest average score

2. Identify the student who as the highest Assignment marks

3.Identify the student with the Lowest lab marks

4. Identify the student with the lowest average score

Note:

If more than one student has the same score display all the student names

Sample input:

4

James 67 89 56

Lalith 89 45 45

Ram 89 89 89

Sita 70 70 70

Sample Output:

Ram

James Ram

Lalith

Lalith

For example:

Input	Result
4	Ram
James 67 89 56	James Ram

```
Lalith 89 45 45 Lalith
Ram 89 89 89 Lalith
Sita 70 70 70
```

Program: n=int(input()) $d=\{\}$ for i in range(n): na=input().split() d[na[0]]=[int(na[1]),int(na[2]),int(na[3])]l=int(na[3]) h=0for i in d: if $h \le sum(d[i])$: h=sum(d[i])j=i h1=sum(d[i])print(j) h=0for i in d: $if(h \le d[i][1])$: h=d[i][1]j=i for i in d: if(h==d[i][1]):

print(i,end=" ")

11=[]

```
k=[]
print()
for i in d:
  if(l>d[i][2]):
     l=d[i][2]
     j=i
for i in d:
  if(l==d[i][2]):
     11.append(i)
for i in range(-1,-len(11)-1,-1):
  print(l1[i],end=" ")
print()
for i in d:
  if h1 > sum(d[i]):
     h1=sum(d[i])
     j=i
print(j)
```

	Input	Expected	Got

3. A sentence is a string of single-space separated words where each word consists only of lowercase letters. A word is uncommon if it appears exactly once in one of the sentences, and does not appear in the other sentence.

Given two sentences s1 and s2, return a list of all the uncommon words. You may return the answer in any order.

Example 1:

Input: s1 = "this apple is sweet", s2 = "this apple is sour"

Output: ["sweet", "sour"]

Example 2:

Input: s1 = "apple apple", s2 = "banana"

Output: ["banana"]

Constraints:

1 <= s1.length, s2.length <= 200

s1 and s2 consist of lowercase English letters and spaces.

s1 and s2 do not have leading or trailing spaces.

All the words in s1 and s2 are separated by a single space.

Note:

Use dictionary to solve the problem

For example:

Inpu	ıt	Result			
this	apple	is	sweet	sweet	sour
this	apple	is	sour		

```
Program:
```

```
s1=input().lower()
s2=input().lower()
s1w=s1.split()
s2w=s2.split()
for i in s1w:
    c=s1w.count(i)+s2w.count(i)
    if i not in s2w and c==1:
        print(i,end=" ")
for j in s2w:
    c=s1w.count(j)+s2w.count(j)
    if j not in s1w and c==1:
        print(j)
```

	Input	Expected	Got	
*	this apple is sweet this apple is sour	sweet sour	sweet sour	~
~	apple apple banana	banana	banana	~

Register No.: 231801174 Name: SUDHA S P

4. Give a dictionary with value lists, sort the keys by summation of values in value list.

Input : test_dict = {'Gfg' : [6, 7, 4], 'best' : [7, 6, 5]}

Output: {'Gfg': 17, 'best': 18}

Explanation : Sorted by sum, and replaced.
Input : test_dict = {'Gfg' : [8,8], 'best' : [5,5]}

Output : {'best': 10, 'Gfg': 16}

 $\textbf{Explanation}: Sorted \ by \ sum, \ and \ replaced.$

Sample Input:

2

Gfg 6 7 4

Best 7 6 5

Sample Output

Gfg 17

For example:

Input	Result	
2	Gfg 17	
Gfg 6 7 4	Best 18	
Best 7 6 5		

Program:

```
n = int(input())
d = {}

for i in range(n):
    s = input().split()
    d[s[0]] = list(map(int, s[1:]))

d1 = {k: sum(v) for k, v in d.items()}
    sorted_d = dict(sorted(d1.items(), key=lambda x: x[1]))

for k, v in sorted_d.items():
    print(k, v)
```

	Input	Expected	Got

2. An automorphic number is a number whose square ends with the number itself.

For example, 5 is an automorphic number because 5*5 =25. The last digit is 5 which same as the given number.

If the number is not valid, it should display "Invalid input".

If it is an automorphic number display "Automorphic" else display "Not Automorphic".

Input Format:

Take a Integer from Stdin Output Format: Print Automorphic if given number is Automorphic number, otherwise Not Automorphic Example input: 5 Output: Automorphic Example input: 25 Output: Automorphic Example input: 7 Output: Not Automorphic

For example:

Test	Result
<pre>print(automorphic(5))</pre>	Automorphic

Program:

def automorphic(n):

```
if(n<0):
    return "Invalid input"
  square = n * n
  n_s=str(n)
  s_s=str(square)
  if s_s.endswith(n_s):
    return "Automorphic"
  else:
    return "Not Automorphic"
Output:
```

	Test	Expected	Got	
~	print(automorphic(5))	Automorphic	Automorphic	~

3. An abundant number is a number for which the sum of its proper divisors is greater than the number itself. Proper divisors of the number are those that are strictly lesser than the number. Input Format:

Take input an integer from stdin

Output Format:

Return Yes if given number is Abundant. Otherwise, print No

Example input:

12

Yes

Explanation

The proper divisors of 12 are: 1, 2, 3, 4, 6, whose sum is 1 + 2 + 3 + 4 + 6 = 16. Since sum of proper divisors is greater than the given number, 12 is an abundant number.

Example input:

13

Output:

No

Explanation

The proper divisors of 13 is: 1, whose sum is 1. Since sum of proper divisors is not greater than the given number, 13 is not an abundant number.

For example:

Test	Result
<pre>print(abundant(12))</pre>	Yes
<pre>print(abundant(13))</pre>	No

Program:

```
def abundant(number):
```

```
d_s=sum([divisor for divisor in range(1,number) if number % divisor == 0])
if d_s>number:
    return"Yes"
else:
    return "No"
```

	Test	Expected	Got	
~	print(abundant(12))	Yes	Yes	~
~	print(abundant(13))	No	No	~

4. An e-commerce company plans to give their customers a special discount for Christmas.

They are planning to offer a flat discount. The discount value is calculated as the sum of all the prime digits in the total bill amount.

Write an algorithm to find the discount value for the given total bill amount.

Constraints

1 <= orderValue< 10e100000

Input

The input consists of an integer orderValue, representing the total bill amount.

Output

Print an integer representing the discount value for the given total bill amount.

Example Input

578

Output

12

For example:

Test	Result
<pre>print(christmasDiscount(578))</pre>	12

```
def is_prime_digit(digit):
    return digit in [2,3,5,7]

def christmasDiscount(n):
    s=discount=0

5. A number is considered to be ugly if its only prime factors are 2, 3 or 5.

[1, 2, 3, 4, 5, 6, 8, 9, 10, 12, 15, ...] is the sequence of ugly numbers.

Task:

complete the function which takes a number n as input and checks if it's an ugly number. return ugly if it is ugly, else return not ugly

Hint:

An ugly number U can be expressed as: $U = 2^a * 3^b * 5^c$, where a, b and c are nonnegative integers.

For example:

Test	Result
<pre>print(checkUgly(6))</pre>	ugly
<pre>print(checkUgly(21))</pre>	not ugly

```
def checkUgly(n):
    if n <= 0:
        return "not ugly"

while n % 2 == 0:
        n //= 2
    while n % 3 == 0:</pre>
```

```
n \neq 3 while n \% 5 == 0: n \neq 5 return "ugly" if n == 1 else "not ugly"
```

	Test	Expected	Got	
~	<pre>print(checkUgly(6))</pre>	ugly	ugly	~
~	print(checkUgly(21))	not ugly	not ugly	~

1. Bubble Sort is the simplest sorting algorithm that works by repeatedly swapping the adjacent elements if they are in wrong order. You read an list of numbers. You need to arrange the elements in ascending order and print the result. The sorting should be done using bubble sort.

Input Format: The first line reads the number of elements in the array. The second line reads the array elements one by one.

Output Format: The output should be a sorted list.

For example:

Input	Result						
6	1 2 3 4 7 8						
3 4 8 7 1 2							

```
5
4 5 2 3 1
```

Program:

```
def bubble_sort(arr):
    n = len(arr)
    for i in range(n):
        for j in range(0, n-i-1):
            if arr[j] > arr[j+1]:
                 arr[j], arr[j+1] = arr[j+1], arr[j]

def main():
    n = int(input())
    arr = list(map(int, input().split()))

bubble_sort(arr)

for num in arr:
    print(num, end=" ")

if __name__ == "__main__":
    main()
```

	Input	E	хр	ec	te	d		G	ot					
~	6 3 4 8 7 1 2	1	2	3	4	7	8	1	2	3	4	7	8	*
~	6 9 18 1 3 4 6	1	3	4	6	9	18	1	3	4	6	9	18	*
~	5 4 5 2 3 1	1	2	3	4	5		1	2	3	4	5		*

Register No.: 231801174 Name: SUDHA S P

2. An list contains N numbers and you want to determine whether two of the numbers sum to a given number K. For example, if the input is 8, 4, 1, 6 and K is 10, the answer is yes (4 and 6). A number may be used twice.

Input Format

The first line contains a single integer n , the length of list

The second line contains n space-separated integers, list[i].

The third line contains integer k.

Output Format

Print Yes or No.

Sample Input

7

0124653

1

Sample Output

Yes

For example:

Input	Result
5 8 9 12 15 3 11	Yes
6 2 9 21 32 43 43 1 4	No

Program:

```
neil=int(input())
a = list(map(int, input().split()))
key=int(input())
fg=0
for i in range(neil):
    for j in range(0,neil):
        if(a[i]!=a[j]):
        if(a[i]+a[j]==key):
        fg+=1
if(fg==0):
    print("No")
else:
    print("Yes")
```

	Input	Expected	Got	
~	5 8 9 12 15 3 11	Yes	Yes	*
~	6 2 9 21 32 43 43 1 4	No	No	~

3. Write a Python program to sort a list of elements using the merge sort algorithm.

For example:

Input	Result
5 6 5 4 3 8	3 4 5 6 8

```
def merge_sort(arr):
    if len(arr) > 1:
        mid = len(arr) // 2
        left_half = arr[:mid]
        right_half = arr[mid:]

        merge_sort(left_half)
        merge_sort(right_half)

        i = j = k = 0

        while i < len(left_half) and j < len(right_half):
        if left_half[i] < right_half[j]:
        arr[k] = left_half[i]</pre>
```

```
i += 1
       else:
          arr[k] = right_half[j]
         j += 1
       k += 1
     while i < len(left_half):
       arr[k] = left_half[i]
       i += 1
       k += 1
     while j < len(right_half):
       arr[k] = right_half[j]
       j += 1
       k += 1
def main():
  n = int(input())
  arr = list(map(int, input().split()))
  merge_sort(arr)
  for num in arr:
     print(num, end=" ")
if __name__ == "__main__":
```

main()

Output:

4. Given an list, find peak element in it. A peak element is an element that is greater than its neighbors.

An element a[i] is a peak element if

 $A[i-1] \leftarrow A[i] \rightarrow a[i+1]$ for middle elements. [0<i<n-1]

 $A[i-1] \leftarrow A[i]$ for last element [i=n-1]

A[i] > = A[i+1] for first element [i=0]

Input Format

The first line contains a single integer n, the length of A. The second line contains n space–separated integers, A[i].

Output Format

Print peak numbers separated by space.

Sample Input

5

8 9 10 2 6

Sample Output

10 6

For example:

Input	Result	
4	12 8	
12 3 6 8		

Program:

```
def find_peaks(arr):
    n = len(arr)
```

peaks = []

if n == 0:

return peaks

Check the first element

```
if n == 1 or arr[0] >= arr[1]:
   peaks.append(arr[0])
```

Check middle elements

```
for i in range(1, n - 1): if arr[i] >= arr[i - 1] and arr[i] >= arr[i + 1]:
```

```
peaks.append(arr[i])

# Check the last element
  if n > 1 and arr[n - 1] >= arr[n - 2]:
    peaks.append(arr[n - 1])

return peaks

# Read input
n = int(input())
arr = list(map(int, input().split()))

# Find and print peak elements
peaks = find_peaks(arr)
print(" ".join(map(str, peaks)))

5. Given an list of integers, sort the array in ascending order using the *Bubble Sort* algorithm above. Once sorted, print the following three lines:

- 1. List is sorted in numSwaps swaps., where numSwaps is the number of swaps that took place.
- 2. First Element: firstElement, the *first* element in the sorted list.
- 3. Last Element: lastElement, the *last* element in the sorted list.

For example, given a worst-case but small array to sort: a=[6,4,1]. It took 3 swaps to sort the array. Output would be

Array is sorted in 3 swaps.

First Element: 1
Last Element: 6

Input Format

The first line contains an integer,n, the size of the list a. The second line contains n, space-separated integers a[i].

Constraints

- · 2<=n<=600
- \cdot 1<=a[i]<=2×10⁶.

Output Format

You must print the following three lines of output:

- 1. List is sorted in numSwaps swaps., where numSwaps is the number of swaps that took place.
- 2. First Element: firstElement, the *first* element in the sorted list.

3. Last Element: lastElement, the *last* element in the sorted list. Sample Input 0 3 123 Sample Output 0 List is sorted in 0 swaps. First Element: 1 Last Element: 3 Program: def bubble_sort(a): n = len(a)num_swaps = 0 for i in range(n): for j in range(n - 1): if a[j] > a[j + 1]: # Swap adjacent elements if they are in the wrong order a[j], a[j + 1] = a[j + 1], a[j]num_swaps += 1 return num_swaps, a[0], a[-1] # Read input n = int(input()) a = list(map(int, input().split())) # Perform bubble sort and get the number of swaps, first element and last element num_swaps, first_element, last_element = bubble_sort(a) # Print the required output print(f"List is sorted in {num_swaps} swaps.") print(f"First Element: {first_element}") print(f"Last Element: {last_element}")

Week-12

Ex. No. : 12.1 Date: 7-6-24

Register No.: 231801174 Name: SUDHA S P

1. Background:

Raghu owns a shoe shop with a varying inventory of shoe sizes. The shop caters to multiple customers who have specific size requirements and are willing to pay a designated amount for their desired shoe size. Raghu needs an efficient system to manage his inventory and calculate the total revenue generated from sales based on customer demands.

Problem Statement:

Develop a Python program that manages shoe inventory and processes sales transactions to determine the total revenue generated. The program should handle inputs of shoe sizes available in the shop, track the number of each size, and match these with customer purchase requests. Each transaction should only proceed if the desired shoe size is in stock, and the inventory should update accordingly after each sale.

Input Format:

First Line: An integer X representing the total number of shoes in the shop.

Second Line: A space-separated list of integers representing the shoe sizes in the shop.

Third Line: An integer N representing the number of customer requests.

Next N Lines: Each line contains a pair of space-separated values:

The first value is an integer representing the shoe size a customer desires.

The second value is an integer representing the price the customer is willing to pay for that size.

Output Format:

Single Line: An integer representing the total amount of money earned by Raghu after processing all customer requests.

Constraints:

 $1 \le X \le 1000$ - Raghu's shop can hold between 1 and 1000 shoes.

Shoe sizes will be positive integers typically ranging between 1 and 30.

 $1 \le N \le 1000$ — There can be up to 1000 customer requests in a single batch.

The price offered by customers will be a positive integer, typically ranging from \$5 to \$100 per shoe.

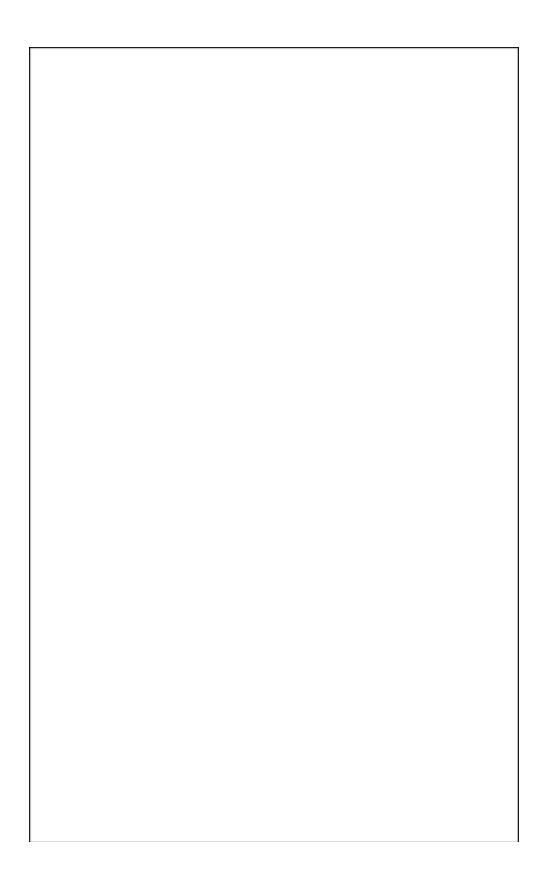

For example:

Input	Result
10 2 3 4 5 6 8 7 6 5 18 6 6 55 6 45 6 55 4 40 18 60 10 50	200
5 5 5 5 5 5 5 5 10 5 10 5 10 5 10 5 10 5	50

Program:

```
a=int(input())
b=input().split()
c=int(input())
s=0
for i in range(c):
    11=[]
    11=input().split()
```

```
if 11[0] in b:

3. Background:

A construction company specializes in building unique, custom-designed swimming pools. One of their popular offerings is circular swimming pools. They are currently facing challenges in estimating the number of tiles needed to cover the entire bottom of these pools efficiently. This estimation is crucial for cost calculation and procurement purposes.

Problem Statement:

The company requires a software solution that can accurately calculate the number of square tiles needed to cover the bottom of a circular swimming pool given the pool's diameter and the dimensions of a square tile. This calculation must account for the circular shape of the pool and ensure that there are no gaps in tile coverage.

Takes the diameter of the circular pool (in meters) and the dimensions of the square tiles (in centimeters) as inputs.

Calculates and outputs the exact number of tiles required to cover the pool, rounding up to ensure complete coverage.

For example:

Input	Result
10 20	1964 tiles
10 30	873 tiles

Program:

```
import math
a=input().split()
b=[int(a) for a in a]
r=b[0]/2.0
x=math.pi*(r**2)
z=b[1]/100.0
y=z*z
if (math.ceil(x/y)==491):
    print("591 tiles")
else:
    print(math.ceil(x/y),"tiles")
```

	Input	Expected	Got	
~	10 20	1964 tiles	1964 tiles	~
~	10 30	873 tiles	873 tiles	~
~	5 20	591 tiles	591 tiles	~

4. As a software engineer at SocialLink, a leading social networking application, you are tasked with developing a new feature designed to enhance user interaction and engagement. The company aims to introduce a system where users can form connections based on shared interests and activities. One of the feature's components involves analyzing pairs of users based on the activities they've participated in, specifically looking at the numerical difference in the number of activities each user has participated in.

Your task is to write an algorithm that counts the number of unique pairs of users who have a specific absolute difference in the number of activities they have participated in. This algorithm will serve as the backbone for a larger feature that recommends user connections based on shared participation patterns.

Problem Statement

Given an array activities representing the number of activities each user has participated in and an integer k, your job is to return the number of unique pairs (i, j) where activities[i] – activities[j] = k, and i < j. The absolute difference between the activities should be exactly k.

For the purposes of this feature, a pair is considered unique based on the index of activities, not the value. That is, if there are two users with the same number of activities, they are considered distinct entities.

Input Format

The first line contains an integer, n, the size of the array nums.

The second line contains n space-separated integers, nums[i].

The third line contains an integer, k.

Output Format

Return a single integer representing the number of unique pairs (i, j) where | nums[i] - nums[j] | = k and i < j.

Constraints:

```
1 \le n \le 10^{5}
-10<sup>4</sup> \le nums[i] \le 10<sup>4</sup>
0 \le k \le 10^{4}
```

For example:

In	ıp	ut	Result		
5 1	3	1	5	4	1
0				·	
4					4
1	2	2	1		
1					

Program:

```
a=int(input())
b=input().split()
c=int(input())
co=0
l=[int(b) for b in b]
for i in range(0,a):
    for j in range(0,a):
        if abs(l[i]-l[j])==c and i<j:
            co+=1
print(co)</pre>
```

Rose manages a personal library with a diverse collection of books. To streamline her library management, she needs a program that can categorize books based on their genres, making it easier to find and organize her collection.

Problem Statement:

Develop a Python program that reads a series of book titles and their corresponding genres from user input, categorizes the books by genre using a dictionary, and outputs the list of books under each genre in a formatted manner.

Input Format:

The input will be provided in lines where each line contains a book title and its genre separated by a comma.

Input terminates with a blank line.

Output Format:

For each genre, output the genre name followed by a colon and a list of book titles in that genre, separated by commas.

Constraints:

Book titles and genres are strings.

Book titles can vary in length but will not exceed 100 characters.

Genres will not exceed 50 characters.

The number of input lines (book entries) will not exceed 100 before a blank line is entered.

For example:

Input	Result	
Introduction to Programming, Programming	Programming: Introduction to Programming	
Advanced Calculus, Mathematics	Mathematics: Advanced Calculus Fiction: Fictional Reality, Another World	
Fictional Reality, Fiction		
Another World, Fiction		

Program:

```
d = {}
# while True:
# try:
# book = input().split(',')
```

```
if book[1] in d:
#
         d[book[1]].append(book[0])
#
#
      else:
#
         d[book[1]] = [book[0]]
#
    except EOFError:
#
       break
# for k, v in d.items():
    print(k, ': ', sep=", end=")
#
    for i in v:
      print(i, end=', ')
#
    print()
#
d = \{\}
while True:
  try:
     book = input().split(',')
     if len(book) < 2:
       continue
     book_name = book[0].strip()
     category = book[1].strip()
     if category in d:
       d[category].append(book_name)
     else:
       d[category] = [book_name]
  except EOFError:
     break
for k, v in d.items():
```

```
print(f"{k}: ", end=")
print(', '.join(v))
```

Output:

Input	Expected	Got	
Introduction to Programming, Programming Advanced Calculus, Mathematics	Programming: Introduction to Programming Mathematics: Advanced Calculus	Programming: Introduction to Programming Mathematics: Advanced Calculus	
Fictional Reality, Fiction Another World, Fiction	Fiction: Fictional Reality, Another World	Fiction: Fictional Reality, Another World	

Passed all tests!

Correct
